Healthcare faxing that works

Sfax is the best alternative to traditional faxing. You can send, receive, annotate, digitally sign, and manage faxes without printing a single physical document. All your documents are stored on encrypted cloud-based servers. Nothing is ever stored on a local hard drive or server, where you run the risk of compromising data security.

Sfax provides you with a host of productivity tools to help limit tedious and time-consuming manual processes and mounds of paper and improve your document workflow. You can control access, track usage, and help protect documents and data.

Benefits at a glance

- Incoming faxes do not sit on publically-available fax machines. They are automatically routed to a recipient's secure inbox
- Notifications are sent to recipient's inbox with a link to a specific fax
- Capacity to process high volumes of inbound and outbound faxes
- Cover pages are tightly controlled
- Senders select recipients from established lists reducing the chance of incorrectly specifying the destination fax number
- Complete end-to-end audit trail of all fax activity

Transaction security

HIPAA has particular requirements for exchanging PHI, and specifically around faxing PHI, to ensure that the privacy and security of the information is protected throughout the entire document lifecycle.

Sfax is OTT's secure HIPAA-compliant cloud-based fax solution. Not only are these solutions intrinsically superior to manual faxing, they are entirely capable of meeting the specific HIPAA requirements for faxing.
